China plans to accelerate construction of new energy including wind and nuclear power as part of its RMB 580 billion total investment in electricity in 2009, reports China Securities Journal quoting a National Energy Administration chief at the National Energy Conference on February 3. The government plans to set up several 10GW-level wind power bases in Gansu, Inner Mongolia, Hebei and Jiangsu provinces over the next ten years, said the report.

China has added 100 million kilowatts of electricity annually for the last few years to reach 792GW in 2008, second after the U.S, reports Shanghai Securities News.
